

## Can indoor fiber optic cables be bent

### Overview

Yes, fiber cables can be bent during installation, which proves particularly useful when you pull cables into position rather than using blown installation methods. Blown fiber installation uses air pressure to propel cables through conduits, minimizing bending stresses. Fiber optic cable bend radius is a critical mechanical parameter that determines how sharply a cable can be bent without risking microbending, macrobending, signal loss, or long-term structural fatigue. While designing an optical fiber cable for any of the applications like duct, underground buried, aerial and Indoor, the cable design engineer needs to consider some of the mechanical parameters of Optical fibers and cables. Let us see the important parameters that affect mechanical integrity of.
