

Cascading of Fiber Optic Switches

Overview

A cascading connection is a common switch connection method that allows multiple switches to be connected to expand the network size and increase the number of ports. Cascading connections form a link by connecting the ports of one switch to the ports of another switch, and larger networks can be. It usually depends on the model of the switches you going to use and for what purpose ?

And also how many switches ?

Personally, if going to use “core switch”, then likely the practice would be to use “distribution” switches as well. The other name for “ring” is cascading where core connects to. The connection between two or more Ethernet switches in a certain way (Uplink port, etc. Multiple switches can be cascaded in various ways according to. Switch optical port intercommunication means that the optical fiber ports of two switches are connected to each other to achieve the purpose of network connection. Up to 9 channels can be switched within milliseconds. Stacking is the consolidation of.
