

# Configuration of Core Switch in Security Network

## Overview

Configure AAA on core switches that function as control devices, including configuring a RADIUS server template, AAA schemes, and authentication domains to enable user authentication, authorization, and accounting through RADIUS, as well as configuring parameters for. Configure AAA on core switches that function as control devices, including configuring a RADIUS server template, AAA schemes, and authentication domains to enable user authentication, authorization, and accounting through RADIUS, as well as configuring parameters for. High Performance: Core switches are designed for italic high-speed data transfer, minimizing bottlenecks and ensuring optimal network performance. Scalability: They can handle a italic large number of connections italic and adapt to growing network demands. Redundancy: Many core switch. Here are some best practices for securing Cisco switches in enterprise environments: 1. Secure Access to the Switch Use Strong Passwords: Configure strong, unique passwords for all switch accounts, avoiding default or weak credentials. This includes routing protocols such as the BGP, OSPF, signaling protocols etc. Data Plane: The data plane is responsible for moving data. Quality of Service (QoS): Quality of Service (QoS) is essential in core switches. Since the networks are highly demanding and a massive amount of data passes through the core layer, the QoS enables the selective transmission of data. With the Fortinet solution for integrated networking using FortiLink, the core layer always comprises a set of two to four FortiGate devices and two very high-speed FortiSwitch units, which support a large number of 100-GbE and/or 40-GbE ports with enough capacity to grow the links between them and.
