

Does the Industrial Internet of Things IIoT have AI servers

Overview

The Industrial Internet of Things (IIoT) takes networked sensors and intelligent devices and puts those technologies to use directly on the manufacturing floor, collecting data to drive artificial intelligence (AI) and predictive analytics. Sathishkumar Balasubramanian, Head of Products at Siemens EDA, shared valuable insights on this subject in Liz Allan's recently published SemiEngineering. This connectivity allows for data collection, exchange, and analysis, potentially. 40 percent of the digital transformation initiatives in 2019 are powered by AI. (Source: IDC) There will be more than 64 billion IoT devices by 2025, up from about 10 billion in 2018. (Source: Business Insider) Business investment will account for more than 50 percent of the overall IoT spending in. Industrial internet of things

SummaryOverviewHistoryStandards and frameworksApplication and industriesSecurity

The industrial Internet of things (IIoT) refers to interconnected sensors, instruments, and other devices networked together with computers" industrial applications, including manufacturing and energy management. This connectivity allows for data collection, exchange, and analysis, potentially facilitating improvements in productivity and efficiency as well as other economic benefits. The IIoT is an evolution of a distributed control system (DCS) that allows for a higher degree of automation by using cloud computing

Industrial Internet of Things (IoT) Trends for 2026
