

Does the epon device need to be replaced

Overview

The original EPON ONU and EPON OLT equipment must be eliminated in the process of system upgrading from EPON to GPON. An XPON ONU is a device that supports both the EPON IEEE 802. It integrates the hardware and software elements of both GPON and EPON, enabling it to automatically switch between the two modes based on the protocol used by the upstream Optical Line. There is no need for powered splitters. EPON gives high bandwidth and can grow easily. This makes it a good choice for internet service providers. When thinking about EPON, look at how many users you have. Review. PON (Passive Optical Network), as an access network technology, can implement fiber optic to the home, satisfying the high-bandwidth requirement of the "last kilometer" in the access layer network. PON mainly adopts a point-to-multipoint network. At the heart of this evolution are Passive Optical Networks (PON)-built around OLT + ONU/ONT + ODN (splitters)-which enable point-to-multipoint fiber access with excellent cost per user and energy efficiency. This guide will walk you through: Whether you're an ISP, a university, a hotel group, or.
