

Frequent up down of access switch interfaces

Overview

You can use the following commands on CLI to check the status of the interfaces. The Output log lines will show the change of the interface status and help to find if the interface was frequently up and down or not: `grep -E "Link. *is (DOWN|UP)" /var/log/ltm* | sed -r 's/^ :]+: //g' | .` The same port is going up and down many times and it is not about one switch or one user. There are no specific requirements for this document. This document applies to Catalyst switches that run on Cisco IOS® System Software. Is this a normal thing?

Should I be troubleshooting layer 1?

3650: Hardware is Gigabit Ethernet, address is 0027. All phones a part of voice VLAN Strangely, when we connect. I am a novice with Cisco switches – I have a switch with some ports that keep oscillating between up and down: Here are the settings on port 1/0/22: How do I diagnose this problem?

Post a “show interface fastEthernet 1/0/22” from CLI, or screen from Cisco Network Assistant (interface status, errors).

Access Interfaces Frequent up/down : r/Cisco - Reddit

You can probably run a tdr cable test from the switch. If the cable checks out then I would test the port with a different device to make sure it's not an issue with the switch port.
