

How many layers should cable trays be configured for

Overview

The general rule for sizing the cable tray is that all cables must be installed in a single layer, and there must be space between each pair of cables: The diameter of the larger cable is equal to the space between two multi-core cables. Cable trays play a vital role in supporting electrical cables and wires in commercial, industrial, and utility installations. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray is configured for instrumentation and control applications that require. This publication is intended as a practical guide for the proper and safe* installation of cable ladder systems, cable tray systems, channel support systems and associated supports. This article provides a comprehensive framework that governs various aspects of cable tray installations, including.
