

# How to connect copper fiber optic cables in parallel

## Overview

The MPO/MTP connector is a multi-fiber connector designed to handle parallel fiber transmission, typically 8, 12, 16, or 24 fibers per connector. A few weeks ago, we discussed duplex MMF cabling. When transceiver technology can't keep up with Ethernet speed requirements, the most obvious solution is to move from duplex to parallel. Fiber media converters allow you to connect two different types of network infrastructure: fiber-optic and copper (Ethernet). In this blog post, we will use fiber optic cable to link SFPs that are inserted into the two sides of media converters. In addition, if we want to use a media converter to back up multiple IP devices, we can connect the media converter to a network. This guide provides a comprehensive overview of how to choose the right equipment, correctly install fiber and network cables, and optimize network settings to ensure reliable and efficient connectivity. Fiber media converters translate copper's electrical signals into fiber's optical signals, and fiber optics is injury to the eye. It is intended to be used as a general reference document to supplement the training supplied through one of the 3M or a 3M cabling system is provided. Unlike fiber splicing, which is permanent, connectors allow for easy connection and disconnection of cables, making them ideal for maintenance and flexibility in.
