

# Is 12b fiber optic cable single-mode or dual-mode

## Overview

Because single mode fiber optic cable supports a single light source mode, it has lower attenuation and less dispersion. As a result, it can provide a nearly unlimited amount of bandwidth. That makes it the preferred choice for high-speed interconnections over long distances in. Single mode fiber optic cable is made up of a small diameter glass or plastic core surrounded by cladding, which is a layer of reflective material. This small diameter core, typically around 9 microns in diameter, allows only one mode of light to pass through, resulting in a narrower beam of light. There are two main types of fiber optic cables: single mode and multimode. From the fiber core and core size to single mode fiber and multimode fiber cables, each type of optical cable serves a specific purpose depending on transmission distance, network. Choosing between single mode and multi mode fiber depends on your specific requirements for distance, bandwidth, and budget. This guide breaks down the technical differences and practical applications of each fiber type.
