

Measures to prevent cold bridging in cable trays

Overview

This involves using the correct cable size, avoiding over-bending cables, and ensuring cables are fixed properly to avoid unnecessary movement. A cold bridge, also known as a thermal bridge, is a common issue in building construction that can lead to increased energy consumption, reduced comfort, structural problems, and even litigation. Some general guidelines on. Key Warming Measures for Cables in Winter To mitigate the effects of frost and snow, the following warming measures can be applied: Heat tracing systems involve installing electric heating elements along cables to maintain a stable temperature and prevent freezing. They occur where materials which are better conductors of heat are allowed to form a 'bridge' between the inner and outer face of a construction. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray cont d for instrumentation and control applications that require.
