

Optical modules belong to radio frequency modules

Overview

In order to save power within the module, optical modules have been made that used the digital interface definition, such as the CEI, but without retiming the signals within the module. Overview An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Optical modules typically have an electrical interface on the side that connects to the system. There have been multiple variants of the electrical interface of optical modules that have been used over the years. The earliest forms of optical modules had an analog electrical interface. In the transmit direction, many different forms of optical modulation and multiplexing have been employed in optical modules. The most common modulation technique historically has been NRZ.
