

Packet loss occurs when a bridge connects to a switch

Overview

Check the cabling between your bridge and the hub or switch to which it is connected. If packet loss occurs while connecting a switch to a server, perform these steps: Verify that the cable is good by using a cable tester or replace it with a known good cable. Verify that the Network Interface Card (NIC) is compatible and working properly. Imagine ordering a desk that ships in five boxes. Boxes 1, 2, 4, and 5 arrive undamaged, but box 3—containing every last screw, bolt, and connector, of course—has gone missing in logistics-land. Every router belongs to one of the apartments in the complex So, the internet activity of all 6 apartments goes. Packet loss is when a piece of data sent from one networked device to another fails to arrive, and can occur for a variety of reasons. The first thing to do when troubleshooting it is to isolate where the loss is occurring.
