

## Should outdoor fiber optic cables be threaded through wells using conduits

### Overview

Laid directly in soil without conduit. Must resist crushing, moisture, and rodents. Use armored or water-blocked designs. Easier to replace or upgrade later than direct-buried. Underground cables are pulled in conduit that is buried underground, usually 1-1.2 meters (3-4 feet) deep to reduce the likelihood of accidentally being dug up. In extreme cold climates, cables may need to be buried at greater depths where temperatures are colder and frost penetrates to. The Fiber Optic Association, Inc. (FOA) was founded in 1995 to help develop the workforce to build the fiber optic networks to support a rapid expansion in communications and the Internet. My current plan is to run 2" or 3" PVC conduit across the two building (clamped to the underside of a metal stairwell and on each building mount a 10x10 (or whatever size is recommended) PVC box. Another benefit of using the fiber optic cable in protective conduit is that it protects the breakable glass fibers from physical pressures in the ground. Directly buried cables are exposed to challenges such as rocks, roots, rodents, excavation, frost heaves, and many others.
