

Testing the condition of optical cables using cables

Overview

Fiber optic cable is tested to ensure continuity and attenuation. Basically, there are three methods commonly performed for optical fiber testing: visible light source, power meter and light source (one jumper method), and optical time domain reflectometer (OTDR). In FTTH, ODN, and data center deployments. We'll explain why it's vital to test fiber optic cables, the three most popular methods, and when you should use them. Related: Fiber Optic Connectors - Identification Guide Regularly testing fiber optic cables helps minimize network downtime, lengthens the network's longevity, reduces maintenance. These test procedures assess the physical and functional qualities of fiber optic cables, connectors, and the network as a whole. Fiber optic testing of a newly installed system not only verifies that the system meets its design requirements, but also creates a performance baseline for all future testing and troubleshooting of the system. This test requires a special testing kit and protective eyewear, but it will help you diagnose problems with the cable's.
