

The distribution box can use an industrial grounding electrode

Overview

The NEC does not allow grounding equipment directly to a grounding electrode. The core purpose of NEC Article 250 is threefold: to limit voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines; to stabilize voltage during normal operation; and to facilitate overcurrent device operation during ground faults. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used.

Grounding of the units: Attach a ground wire from one of. Electrode Placement: In order to maximize the performance of the grounding system, it is recommended that grounding electrodes, which include rods and plates, be strategically placed around the substation and at strategic locations. The positioning ought to take into account the resistivity of the. The system grounding arrangement is determined by the grounding of the power source. It can also be an aid to all engineers responsible for the.
