

The function of shielded beam splitters

Overview

The device is purely passive, redirecting light energy based on carefully engineered surface properties. Beamsplitters enable complex light manipulation across diverse scientific and industrial fields, underpinning numerous advanced optical systems. It is a crucial part of many optical experimental and measurement systems, such as interferometers, also finding widespread application in fibre optic telecommunications. a laser beam) into two (or sometimes more) beams, which may or may not have the same optical power (radiant flux). Different types of beam splitters exist, as described in the. The most basic function of a beam splitter is to divide an incoming light beam into two or more beams with specific intensity ratios. This division allows for the simultaneous analysis or utilization of the light's properties along two separate paths. For a lossless beam splitter, $R + T = 1$.
