

Tunnel power distribution box configuration

Overview

The standard practice is to install 3300 V “Half Couplers” on transformers that can be electrically interlocked. This “plug and socket” mechanism enables the installation to be quickly expanded as the tunnelling advances. Power supply and distribution in a tunnel Tunnels are home to a variety of applications that need to be supplied with power in a high-availability configuration. Particularly critical subsections, such as ventilation and lighting, must continue to work even in emergency situations, for example. A wide variety of LV electrical distribution equipment can be required on a tunnel project. Main LV supplies into tunnels are often provided with a back-up stand-by generator and our Mains Distribution Assemblies (MDAs) can incorporate Manual or Automatic Changeover systems to switch between Mains. This installation has to satisfy two essential requirements: Meet the needs under all operational situations (normal, degraded, critical, emergency). To reduce the construction costs. The Tunnel Distribution & Lighting Box provides tunnel contractors with a complete solution for temporary electrical installation that complies with competent local authorities. WE-POWER developed the TDLB to withstand harsh conditions in accordance with BS6164, which provides useful guidance on. For safety illumination in tunnels, we also offer you special AMAXX power distributors: flexibly configurable fuse boxes with a robust housing.
