

What kind of tube should be inserted into a fiber optic splitter

Overview

The tapered region is then solidified with curing glue on a quartz substrate and inserted into a stainless copper tube, forming the optical splitter. Mature technology and process with low development costs. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. This type of device plays an important role in passive. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. 1x32 splits were common in North America for G-PON architectures. As XGS-PON continues to be adopted, some service. Whether housed in box-type, module-type, bare fiber, rack-mount, or tube-type configurations, each serves a specific purpose, from wall mounting to integration into patch panels or equipment racks.
