

## What type of wire should be used in the control circuit of the distribution box

### Overview

Stranded wire is often the better choice for control panels. Solid wire may work for short runs, but is more likely to fatigue over time. Voltage ratings need to match or exceed what is present. For individual loads, UL 508A stipulates that the main current wiring for motors or heating systems should be designed for a current carrying capacity not less than 125 % of the full load current. To help your final product run safely and. The choice of cable colour initially depends on what type of circuit it is, and whether the voltage is AC or DC. This colour combination is reserved specifically for the protective earth and must be maintained throughout. What are the most widely used wire cabling for distribution panelboard applications?

Here are the details of the most frequently selected wiring: Building Wire (THHN/THWN-2) Building wire is used for general wiring purposes. 2 All consumer units in domestic premises must be constructed from non-combustible material (typically metal).
