

## Where are optical splitters usually installed in the server rack

### Overview

Rack-mount fiber optic splitters are passive optical splitters integrated into standard rack-mounted chassis, typically installed in telecom racks, ODF frames, or central office distribution systems. They are compact and modular, allowing for high-density computing within a limited space. They distribute optical power by splitting an incident light beam into multiple beams and vice versa, featuring. Let's assume that you are starting from a relative zero — you already have space in the data center and you have been allocated empty racks (or space for them). It typically has multiple fiber input and output interfaces. At the top of the enclosure is installed equipment with optical ports. Even the finest piece of dust on a fiber-optic adapter, module or connector, can lead to the technical parameters deterioration of a line or, the connection loss in.
