

Which type of switch should be chosen for high-density access points

Overview

An access layer switch should support high port density since it is connected to a large number of end-users and devices. 5 sq m), such as a conference room, classroom, lecture hall, auditorium, sports arena or Conference hall. The concepts stay the same regardless of the size of the challenge. The. Identify network requirements: assess device count, bandwidth needs, traffic patterns, and scalability goals to choose the correct switch type and port density. Select the appropriate switch type: use Layer 2 for basic LAN connectivity and Layer 3 for advanced routing, segmentation, and multi-VLAN. When choosing access layer switches, there are many points to consider, such as port density, port speed, security, scalability, deployment and management methods, as well as cost. High Density is everywhere! AP to Client: How does the client device “hear” the AP?
