

Why do switches use two fiber optic cables for stacking

Overview

When switches are stacked, they're physically connected using special stacking cables or dedicated stacking ports. Some models even use standard Ethernet uplink ports for this purpose. It can provide significantly higher bandwidth and carry more data. I am trying to stack 2960x "WS-C2960X-48LPD-L" switches in two different racks, and racks are far away from each other. (lets say 4 Meters distance between racks). My ask is, how I can create stack between switches using fiber cable (1000BaseSX SFP), I am attaching the pic of closet for better. Switch stacking is an important technology that connects multiple switches together. Stackable switches can improve network scalability, reliability and flexibility, increase bandwidth, and simplify networking. No stack card needs to be purchased, but dedicated stack cables need to be purchased separately.
