

# Width of cable trays in network server rooms

## Overview

Here in the UK, standard widths run from a slim 50mm for a handful of data runs right up to 900mm or more for the heavy-duty containment needed in data centres. Unlike typical commercial or industrial environments, server rooms operate under high cable density, strict uptime requirements, and controlled airflow systems. Poor cable routing can block airflow, increase heat buildup, and make maintenance extremely difficult. Over time, this leads to higher us-trations without notice. The mechanical and electrical characteristics, tests, certifications, overall quality management, recommendations mentioned. Getting the cable tray sizes right is the bedrock of any solid structured cabling project, especially in demanding environments like commercial buildings and hospitals. It simplifies tasks like upgrading, expanding, reconfiguring, or moving networks. The National Electrical Code (NEC) specifies the capacity.
